1 Publication Version Control

The following table contains a history of revisions to this publication.

Publication Version	Date	Revision Description
1.0	10/24/2017	Initial Draft of Document

2 Reviews

- The initial version of the document was prepared by staff from the Virginia Information Technologies Agency (VITA) for the Secretary of Technology, under the direction from the Identity Management Standards Advisory Council (IMSAC).
- The document will be reviewed in a manner compliant with the Commonwealth of Virginia's Administrative Process Act, § 2.2-4000 et seq.

3 Purpose and Scope

Pursuant to § 2.2-436 and § 2.2-437, *Code of Virginia*, this guidance document was developed by the Identity Management Standards Advisory Council (IMSAC), on behalf of the Secretary of Technology, to establish minimum specifications for identity management of Non-Person Entities, so as to warrant liability protection pursuant to the Electronic Identity Management Act ("the Act"), Chapter 50 of Title 59.1. The guidance document, as defined in § 2.2-4001, was prepared to provide information or guidance of general applicability to the public for interpreting or implementing the Act. The guidance document was not developed as a Commonwealth of Virginia Information Technology Resource Management (ITRM) Policy, Standard, and Guideline, pursuant to § 2.2-2007, and therefore the guidance document is not applicable to executive branch agencies of the Commonwealth of Virginia.

29 **4 Statutory Authority**

30

31 The following section documents the statutory authority established in the *Code of Virginia* for
32 the development of minimum specifications and standards for Identity Management of Non-
33 Person Entities. References to statutes below and throughout this document shall be to the
34 *Code of Virginia*, unless otherwise specified.

71 **6 Background**

72

73 In 2015, Virginia’s General Assembly passed the Electronic Identity Management Act (Chapter
74 50 of Title 59.1, *Code of Virginia*) to address demand in the state’s digital economy for secure,
75 privacy enhancing Electronic Authentication and identity management. Growing numbers of
76 “communities of interest” have advocated for stronger, scalable and interoperable identity
77 solutions to increase consumer protection and reduce liability for principal actors in the identity
78 ecosystem – Identity Providers, Credential Service Providers and Relying Parties.

79

80 To address the demand contemplated by the Electronic Identity Management Act, the General
81 Assembly also created the Identity Management Standards Advisory Council (IMSAC) to advise
82 the Secretary of Technology on the adoption of identity management standards and the
83 creation of guidance documents, pursuant to §2.2-436. A copy of the IMSAC Charter has been
84 provided in **Appendix 1**.

85

86 The Advisory Council recommends to the Secretary of Technology guidance documents relating
87 to (i) nationally recognized technical and data standards regarding the verification and
88 authentication of identity in digital and online transactions; (ii) the minimum specifications and
89 standards that should be included in an Identity Trust Framework, as defined in §59.1-550, so
90 as to warrant liability protection pursuant to the Electronic Identity Management Act (§59.1-
91 550 et seq.); and (iii) any other related data standards or specifications concerning reliance by
92 third parties on identity credentials, as defined in §59.1-550.

93

94 **Purpose Statement**

95

96 This guidance document, as defined in § 2.2-4001, was developed by the Identity Management
97 Standards Advisory Council (IMSAC), on behalf of the Secretary of Technology, to provide
98 information or guidance of general applicability to the public for interpreting or implementing
99 the Electronic Identity Management Act. Specifically, the document establishes minimum
100 specifications for identity management of Non-Person Entities (NPEs) in a Digital Identity
101 System. The minimum specifications also outline a data model for interoperability and
102 discovery of identity information on NPEs.

103

104 The document assumes that specific business, legal, and technical requirements for NPEs will
105 be established in the Identity Trust Framework for each distinct Digital Identity System, and
106 that these requirements will be designed based on the Electronic Authentication model,
107 Identity Assurance Level (IAL), and Authenticator Assurance Level (AAL) requirements for the
108 system. The document limits its focus to identity management for NPEs. Minimum
109 specifications for other components of a Digital Identity System have been defined in separate
110 IMSAC guidance documents in this series, pursuant to §2.2-436 and §2.2-437.

111

112 7 Minimum Specifications

113

114 Identity management (IdM) of Non-Person Entities (NPEs) has become a critical issue with the
115 growth in number and level of interconnectedness of “smart” devices, particularly as these
116 devices increasingly become targets of malware and cyber attacks. Despite a substantial focus
117 worldwide on IdM of person entities, the parallel effort on IdM of NPEs has not achieved a
118 similar level of maturity.

119

120 The National Institute of Standards and Technology (NIST) in Special Publication (SP) 800-63-3,
121 and through the National Program Office of the National Strategy for Trusted Identities in
122 Cyberspace (NSTIC), has established processes, protocols, and related guidance for IdM on
123 persons but has not offered the same level of treatment for NPEs. Federal and State Identity
124 Credential Access Management (FICAM/SICAM) Guidelines reference NPEs but do not define
125 specific protocols for NPE management.

126

127 In recent years, international organizations have made substantial contributions to the
128 knowledge-base relating to IdM of NPEs. Much of this effort stems from analysis on the
129 “Internet of Things” (IoT), defined by the International Telecommunication Union (ITU) as a
130 “global infrastructure for the information society, enabling advanced services by
131 interconnecting (physical and virtual) things based on existing and evolving interoperable
132 information and communication technologies.”²

133

134 The European Commission IoT Expert Group’s Subgroup on Identification, in its current-state
135 analysis of the IoT, noted the following issues associated with IdM of NPEs:

- 136 • Object Identifiers and Protocols: The question of whether to adopt a global, standardized
137 scheme of unique identifiers for NPEs or continue to maintain an array of distinct identity
138 spaces for NPEs with fluctuating degrees of interoperability.
- 139 • Identifiers vs. Network Addresses: The importance of distinguishing between an NPE’s
140 identifier, which establishes a unique handle for the entity, and its network address, which
141 may change based on the NPE’s physical location.
- 142 • Resolution and Discovery Functions: The need to build upon existing knowledge and
143 experience with identification, naming, and addressing systems to resolve disparate
144 identifiers for an NPE and enable discovery across disparate Digital Identity Systems.³

145

146 The European Commission, and other groups such as the Cloud Security Alliance, Kantara
147 Initiative, and Internet Society have published guidance on how to address these and related
148 issues for IdM of NPEs.⁴ Also, the ITU has released recommendations to promote
149 interoperability, resolution, and discovery of identity information on NPEs.⁵

Subgroup on Identification. <http://ec.europa.eu/transparency/regexpert/index.cfm?do=groupDetail.groupDetailDoc&id=7663&no=12>

⁴ Cloud Security Alliance. 2016. *Identity and Access Management for the Internet of Things – Summary Guidance*.
<https://downloads.cloudsecurityalliance.org/assets/research/internet-of-things/identity-and-access-management-for-the-iot.pdf>

150 The minimum specifications defined in this document leverage the guidance and
151 recommendations issued by these international organizations. First, the minimum
152 specifications set general guidelines for IdM of NPEs based on the guidance from the Cloud
153 Security Alliance and Kantara Initiative. Second, the minimum specifications outline a standard
154 data model for NPE identity information conformant with ITU recommendations.⁶ Third, the
155 minimum specifications present a comprehensive use case illustrating the complexity of issues
156 associated with IdM of NPEs and strategies for addressing these issues through a standards-
157 based reference architecture and communications protocols, such as those established by the
158 European Commission and Internet Society.

160 General Guidelines

162 The following general guidelines have been adapted from the CSA's *Identity and Access*
163 *Management for the Internet of Things – Summary Guidance*.

- 165 1. Integrate IdM-NPE implementation into existing IdM and IT governance frameworks.
166 Considerations should include the following steps:
 - 167 a. Define a common namespace for NPEs.
 - 168 b. Establish an extensible identity lifecycle that can be applied to NPEs, designed based on
169 the lifetime of the NPE and required identifier.
 - 170 c. Within the identify lifecycle, establish clear registration processes for NPEs. The rigor of
171 the registration process should be dictated by the sensitivity of the data handled by a
172 particular NPE.
 - 173 d. Determine the level of security protections (confidentiality, authentication,
174 authorization) to be applied to unique data flows from NPE components.
 - 175 e. Establish clear authentication and authorization procedures for local access to NPEs.
 - 176 f. Define privacy protections required for different data categories. (Note: Establishing a
177 framework reference definition for establishing privacy protections of Personally-
178 Identifiable Information (PII) will aid in these definitions.)
 - 179 g. Determine and document whether outside organizations have access to certain
180 categories of data.
 - 181 h. Define how to perform authentication and authorization for NPEs that are only
182 intermittently connected to the network.
 - 183 i. Establish access control requirements that apply to NPEs according to the access control
184 policies defined in the Identity Trust Framework.

⁵ The term “non-person entity” shall be used in this document in place of comparable terms currently in practice, such as “IoT devices,” “digital entities,” “digital objects,” etc., in order to standardize reference terminology and remain consistent with FICAM/SICAM.

⁶ International Telecommunication Union. 2013. *Recommendation X. 1255: Framework for Discovery of Identity Management Information*. <http://www.itu.int/ITU-T/recommendations/rec.aspx?id=11951&lang=en>

- 186 2. Do not deploy NPE assets without changing default passwords for administrative access. If
187 possible, do not deploy NPEs with only local access capabilities. Instead, attempt to
188 integrate all NPE assets into the enterprise IdM system. (Note: This guidance does not apply
189 to consumer-based NPEs that are attached to the enterprise network. New concepts similar
190 to those required for bring-your-own-device (BYOD) registration of devices would need to
191 be applied to that segment of NPE assets.
192
- 193 3. Evaluate a move to Identity Relationship Management (IRM) in place of traditional IAM, as
194 recommended by the Kantara Initiative.⁷ IRM is more suitable to NPEs than traditional IAM
195 and is based on a set of pillars that include a focus on consumers and things over
196 employees, Internet-scale over Enterprise-scale, and Borderless over perimeter. Identify
197 and evaluate IRM vendor solutions as a possible fit for NPE identity requirements.
198
- 199 4. Design authentication and authorization schemes based on system-level threat models.
200 Evaluate each individual NPE asset's implementation and choose vendors that have adhered
201 to applicable standards and/or sought guidance or followed best practices from industry
202 security groups. Take into account system vulnerabilities.
203
- 204 5. Smartphones for authentication on IoT. Mobile Devices and Telecommunication networks
205 play a major role in the IoT. Smartphones will potentially be used as one means of
206 authentication step to access things surrounding us. The features that makes the
207 smartphone a powerful authentication factor needs to be tightly integrated with other
208 devices. The next generation smartphones would drive different types of authentication
209 mechanisms like facial recognition using the front-facing camera, voice recognition, gesture
210 dynamics and handling dynamics in addition to traditional biometrics such as fingerprints.
211 These smart phones could be used for enterprise level local authentication to IoT devices.
212
- 213 6. Create reference architectures for your NPE assets using *ITU-T Y.2060: Overview of the*
214 *Internet of Things* as a starting point. NPE reference architectures enable consistent
215 implementation of authentication, authorization, and accounting (AAA) services across all
216 NPE assets in the infrastructure and can be used to test the overall access of systems at
217 every level, from the individual machine to networks of machines at various layers in the
218 technology stack. Identify the most vulnerable devices within the enterprise and apply MFA
219 whenever possible.
220
- 221 7. Plan for the introduction of IPv6. Organizations have not fully moved to IPv6 as the industry
222 is still in a state of prolonged transition. There are many NPEs that are designed to use IPv4,
223 so planning now for how an NPE asset designed to use IPv4 will talk to an NPE asset
224 designed to use IPv6, in a M2M implementation scenario, is needed. To make this feasible,
225 consider a Software Defined Networking (SDN) mechanism that can allow these devices to
226 talk to each other to provide the intended service.
227

⁷ For more information in the Kantara Initiative's guidance on IRM, visit <https://kantarainitiative.org/irmpillars/>

- 228 8. Adopt a Public Key (PK) environment to support provisioning of certificates to NPE assets. The PK
229 environment should implement certificate and cryptographic key controls consistent with
230 Commonwealth Security Standard 501, NIST 800-53-5, or comparable certificate control framework.
231
- 232 9. Establish a plan for sharing NPE-related data with device manufacturers. Device
233 manufacturers will continue to want to have device data access in order to monitor device
234 health, track statistics, and be able to provide support to their customers. This data is
235 collected and stored within various types of databases. Make sure to implement an
236 authorization model for these back-end data stores such that 1) is compliant with relevant
237 privacy regulations and 2) allows the minimal access required by manufacturers and other
238 third parties.
239
- 240 10. Implement an AAA server that allow consumers to define preferences and provide services'
241 consent for access to consumer profile data. An NPE implementation is one such service.
242 This requires management of external identities such as consumers and patients, who are
243 allowed to give their consent preferences for which attributes of their profile information
244 can be shared and to whom. In many cases, this requires the integration of AAA services
245 with third party services that manage consumer and business partner preferences for
246 handling of data.
247
- 248 11. Consider integrating the identity management system with a building's Physical Access
249 Control System (PACS) to enable additional security measures, such as selectively
250 provisioning what doors and entrances a person's badge can access. These security
251 enhancements will provide improved physical protection to NPE assets.
252
- 253 12. Implement restrictive logic in identity management workflows to proactively restrict access
254 to NPE-related systems and devices if a person has not had the necessary prerequisites as
255 specified by the access governance framework. Examples of prerequisites include training
256 and background checks.
257
- 258 13. Implement a privileged user management system to ensure that administrators can access
259 and monitor NPE systems and devices. This includes session monitoring of privileged
260 sessions, protection of passwords to service accounts, and frequent password rotation.
261
- 262 14. Extend where possible the use of current asset management to inventory and document
263 NPE assets. Categorize them based on risk and assign owners. Modify access records to
264 support asset ownership, asset deployment, and any required revocation or asset lifecycle
265 workflows. Integrate a service desk system that audits and automates the opening of tickets
266 so that revocation of physical assets occurs in a system of record.
267
- 268 15. Invest in a well-documented plan for how to respond to failures and breaches when they
269 occur. One example is an Incident Handling or an Incident Response plan. Note that this
270 plan should be made a part of the incident management process and workflows.
271

- 272 16. Establish relationship mappings between people and NPE assets. This includes establishing
273 explicit authorizations for people's authorized behavior on specific data sets. Enforce access
274 management by both users and things. Implement MFA where possible for user access to
275 NPE-centric data.
276
- 277 17. Develop effective AAA mechanisms for sensor nodes based on the context and service
278 security requirements. Wireless sensor nodes can be a key element for NPE asset
279 implementations; however, AAA of the sensor nodes in a wireless mesh network is not yet
280 fool proof due to limitations in energy and computing power. Consider context as a way to
281 determine the rigor of the authentication required based on risk introduced by a particular
282 sensor node. Examples include location/coordinates, time-of-day, end-device/system being
283 accessed, or data types being transmitted/received. Note: In some attack scenarios,
284 context information is easily stolen, forged, or proxied. Also, evaluate the risk associated
285 with context false-negatives and the potential risk that may result when legitimate users are
286 incorrectly blocked (e.g., bad device clocks, upgraded endpoints, unexpected but legitimate
287 locations, loss of GPS signal, etc). Perform threat modeling to determine the most
288 appropriate AAA mechanisms for sensor nodes.
289
- 290 18. Leverage security controls built into standards-based NPE protocols such as CoAP, DDS, and
291 REST to allow for interoperable authentication and authorization transactions between
292 different manufacturers' NPE assets. A list of common NPE communication protocols and
293 assertions has been provided in **Table 1**.
294
295

296
 297

Table 1. Common NPE Communication Protocols and Assertions

Protocol	M2M Authentication Options	Description
MQTT	Username/Password	MQTT allows for sending a username and password, although recommends that the password be no longer than 12 characters. Username and password are sent in the clear, and as such it is critical that TLS be employed when using MQTT.
CoAP	Pre-Shared Key Raw-Shared Key Certificate	CoAP supports multiple authentication options for device-to-device communication. Pair with Datagram TLS (D-TLS) for higher level confidentiality services.
XMPP	Multiple Options Available Depending on Protocol	XMPP supports a variety of authentication patterns via the Simple Authentication and Security Layer (SASL – RFC4422). Mechanisms include one-way anonymous as well as mutual authentication with encrypted passwords, certificates and other means implemented through the SASL abstraction layer.
Zigbee	Pre-Shared Key	Zigbee provides both network and application level authentication (and encryption) through the use of Master key (optional), Network (mandatory) and Application Link keys (optional)
HTTP/REST	Basic Authentication (cleartext) (TLS Methods) OAUTH2	HTTP/REST typically requires the support of the TLS protocol for authentication and confidentiality services. Although Basic Authentication (where credentials are passed in the clear) can be used under the cover of TLS, this is not a recommended practice. Instead attempt to stand up a token-based authentication approach such as OAUTH 2
Bluetooth	Shared Key	Bluetooth provides authentication services through two different device pairing options, Standard and Simple Pairing. The Standard Pairing method is automatic; the Simple Pairing method includes a human-in-loop to verify (following a simple Diffie-Hellman exchange) that the two devices display the same hash of the established key. Bluetooth offers both one-way as well as mutual authentication options. Bluetooth secure simple pairing offers ‘Just works’, ‘Passkey entry’ and ‘Out of Box’ options for device-device authentication
Bluetooth-LE	Unencrypted data authenticated using Connection Signature Resolving Key (CSRK) Device Identity/Privacy is via an Identity Resolving Key (IRK)	Bluetooth-LE introduces a two-factor authentication system, the LE Secure Connections pairing model which combines – based on device capability – several of the available association models available. In addition, Elliptic-Curve Diffie Hellman is used for key exchange.

299 Data Model for NPE Identity Information

300

301 The following data model for NPE identity information has been adapted from ITU
302 *Recommendation X. 1255: Framework for Discovery of Identity Management Information.*

303

304 The data model for NPE identity information described in this section provides a uniform means
305 to represent metadata records as NPEs, and can also be used to represent other types of
306 information as NPEs. It is a logical model that allows for multiple forms of encoding and
307 storage, and enables a single point of reference (i.e., the identifier) for many types of
308 information that may be available in digital form.

309

310 Each NPE has an intrinsic set of attributes, a user-defined set of attributes, embodied in one or
311 more elements and zero or more additional elements containing information such as text,
312 video or images represented in digital form. All of these elements can be made available
313 through a precisely defined NPE specification, which incorporates the capability for
314 authentication using public key security, and perhaps other means of authentication using
315 higher-level APIs, as might be implemented by NPE repositories. This provides access with
316 privacy and security to NPEs.

317

318 The essential fixed attribute of a NPE is its associated unique persistent identifier, which can be
319 resolved to current state information about the NPE, including its location(s), access controls,
320 and validation, by submitting a resolution request to the resolution system. Examples of other
321 intrinsic NPE element attributes are: date last modified, date created, and size. User extensible
322 attributes may be set by the users with appropriate permissions.

323

324 Attributes that are not specifically addressed by the basic NPE data model include ownership,
325 authentication and access terms and conditions. These attributes will be an important part of
326 most NPE implementations; however, a single solution seems unlikely. Ownership and access
327 control information will likely be contained in user extensible NPE attributes or in separate data
328 elements. This provides a common way to deal with various ownership and information
329 management schemes, as well as multiple authentication and authorization schemes, without
330 making the assumption that a single approach will be used across all domains and user
331 communities.

332

333 The combination of a standard data model, a defined protocol for interacting with that data
334 model, and an identifier/resolution system, provides a key ingredient for the coherent long-
335 term management of information in a digital context. The resolution system should be a
336 distributed, secure, high-performance resolution system designed to enable persistent
337 reference to digital entities over long periods of time and over changes in location, access
338 methods, ownership and other mutable attributes.

339

340

341

342 The core capability for discovery of IdM information results from the use of the registry
 343 component, which includes the repository. The function of an individual registry is to federate
 344 across collections of NPEs, enabling end users and applications to search through and navigate
 345 the universe of registered entities.
 346

347 Repositories that contain collections of NPEs can contribute metadata about the NPEs for which
 348 they are responsible to one or more registries. A single registry can collect metadata from
 349 multiple repositories, and a single repository can send metadata to multiple registries. The
 350 registries can provide search and reporting functions over the represented entities and provide
 351 an entry point into the structured world of NPEs and repositories.
 352

353 There may be situations in which the registries are not, strictly speaking, needed, e.g., in the
 354 case where a direct reference to a NPE, in the form of its identifier, is embedded in another NPE
 355 or in a message or other document. In many cases, however, the end user, or automated
 356 process acting on behalf of a user, will not know the identifier to begin with, and will have to
 357 use some variety of search or sorting process to discover the needed reference. Even if a user
 358 knows the identifier, the user may not know how to resolve it, or how to interpret the
 359 resolution results. Recording the existence of NPEs in registries can help to solve that problem
 360 in a very general way.
 361

362 By defining operations that interact with a specified data model, digital entities can be
 363 constructed and used to represent most types of structured information. A standard NPE data
 364 model has been illustrated in **Figure 1**. Representation of the entities in a form that is
 365 independent of the implementation details of the relevant storage system is an essential
 366 interoperability feature, as it allows multiple storage formats and approaches to be normalized
 367 to a single logical model.
 368

	User-Defined Attributes	
	Data	

Source: ITU Recommendation X.1255, p. 9.

371
 372

373 Except for the persistent identifier at the top, all data shown in Figure 1 is conceptual only. Each
374 element of a digital entity can take different forms, i.e., digital entity references by identifier, an
375 actual digital entity, plain local data suitably typed.

376

377 Registries may use or incorporate repositories to store metadata records; and repositories are
378 information management systems that provide access to collections of NPEs via the digital
379 entity interface protocol. Repositories may generally be thought to incorporate the digital
380 entities to which they provide access. A more detailed view however, would show them as
381 portals into various storage and information systems, mapping the raw data into digital entities
382 that may be stored locally or remotely. This could be as simple as a file system holding the data
383 for a given NPE in one or more files that are not known or visible to the user.

384

385 Alternatively, especially for complex digital entities, data may be spread across multiple
386 locations and systems and brought together in NPE form only on demand, with one storage
387 component holding the “map” of the entity and the bulk of the data held in other systems. This
388 technique of interacting with existing systems is key to federation, as the information in an
389 arbitrarily complex information system can be logically divided into NPEs, and those NPEs made
390 available in a standardized fashion, using an instance of a NPE within user-centric applications.

391

392 A NPE client can locate one or more repositories for a given NPE by resolving its identifier. The
393 resolution request will return the location of one or more relevant repositories with which the
394 client can initiate a NPE transaction.

395

396 The NPE repository software normally provides multiple network interfaces for performing
397 operations on digital entities, namely, the digital entity interface protocol for interacting with
398 the NPE itself, as well as locally desirable interfaces as determined by current technology
399 options. The various interfaces each have their own benefits in terms of security, compatibility
400 with proxy servers and the use of ubiquitous client software. Redundancy is built into the digital
401 entity interface protocol, along with strong individual and group authentication. Redundancy is
402 supported by a mirroring system in which each NPE repository communicates with the others
403 to ensure that replicated entities are kept in sync. Authentication is based on either secret or
404 public/private keys or other authentication mechanisms.

405

406 Other notable features include replication, allowing easy mirroring across repositories and
407 extensibility through a plug-in mechanism. Plug-ins could be built to manage both entity type
408 specific activities, e.g., parsing a video format and dispensing a requested section, or activities
409 oriented to network services, e.g., contributing metadata to a NPE registry.

410

411

413

414

415

416 8 IdM of NPE Use Case: Public Health Emergency Response

417

418 Purpose: To illustrate the complex challenges associated with IdM of NPEs across jurisdictions
419 and domains of governance. An architecture model outlining the IdM and communications
420 protocols required for the use case has been provided in **Figure 2**.

421

422 Use Case Scenario: Emergency response involving a biological hazard event within a populated
423 urban area. Public health officials/NPEs must communicate with emergency management
424 personnel/NPEs and hospital personnel/NPEs to address the public health impacts resulting
425 from the biological hazard.

426

427 NPE Settings:

428 Human – NPEs attached to or inside the human body for vital signs

429 Hazard Site – NPEs for remote sensing of conditions in urban hazard zone

430 Vehicles – NPEs and applications/components within drone units

431 Supplies – NPEs delivered by drones, such as medications, and their tracking devices

432 Built Environment – NPEs for monitoring conditions in residential/commercial structures⁸

433

434 Runtime Flows (Figure 2):

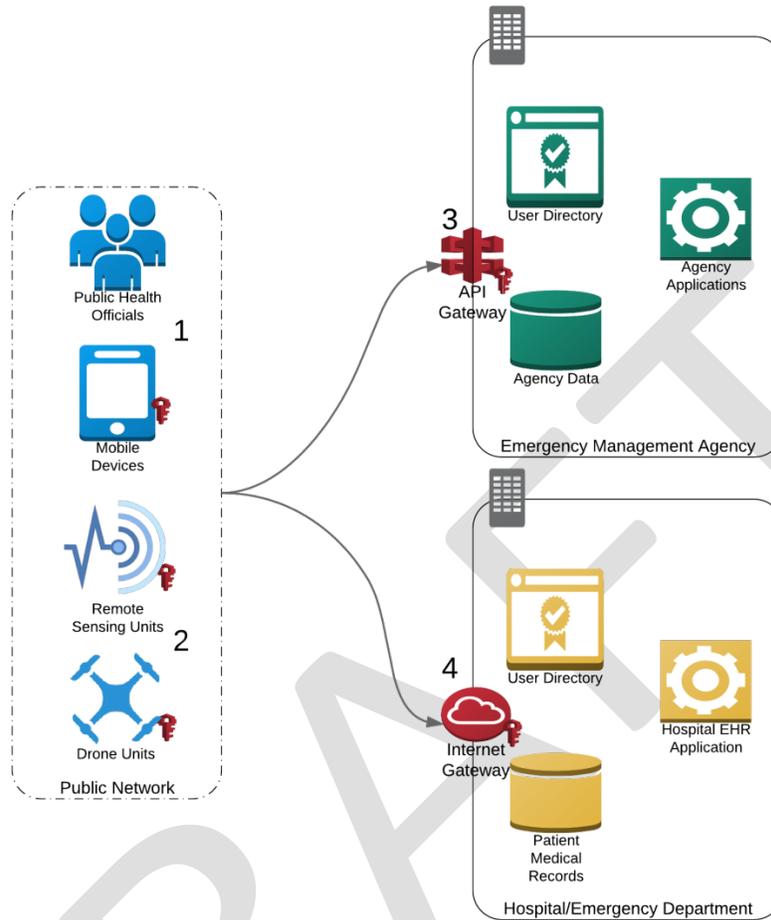

- 435 1. Public health officials rely on authenticated NPEs for mobile communications and to
436 monitor real-time feeds from remote sensing units to evaluate air, soil, and water
437 conditions within the hazard zone – both in the outside and in the built environment
438 (machine-to-machine).
- 439 2. Public health officials use authenticated drone technology to deliver medical supplies
440 and measure vital signs of affected persons onsite (human-machine); IdM and data
441 management must be compliant with the Health Insurance Portability and
442 Accountability Act (HIPAA, P.L. 104-191) Security and Privacy Rules.
- 443 3. Public health officials authenticate to the emergency management agency's applications
444 to submit data from monitoring activity (application/API).
- 445 4. Public health officials authenticate to a hospital's electronic health record system to
446 submit patient-level data collected from persons within hazard zone in advance of
447 transport to the emergency department (application/API); IdM and data management
448 must be compliant with the Health Insurance Portability and Accountability Act (HIPAA,
449 P.L. 104-191) Security and Privacy Rules.

456 Appendix 1. IMSAC Charter

457

458

459

460

461

462 **Advisory Council Responsibilities (§ 2.2-437.A; § 2.2-436.A)**

463

464 The Identity Management Standards Advisory Council (the Advisory Council) advises the
465 Secretary of Technology on the adoption of identity management standards and the creation of
466 guidance documents pursuant to § 2.2-436.

467

468 The Advisory Council recommends to the Secretary of Technology guidance documents relating
469 to (i) nationally recognized technical and data standards regarding the verification and
470 authentication of identity in digital and online transactions; (ii) the minimum specifications and
471 standards that should be included in an Identity Trust Framework, as defined in § 59.1-550, so
472 as to warrant liability protection pursuant to the Electronic Identity Management Act (§ 59.1-
473 550 et seq.); and (iii) any other related data standards or specifications concerning reliance by
474 third parties on identity credentials, as defined in § 59.1-550.

475

476 **Membership and Governance Structure (§ 2.2-437.B)**

477

478 The Advisory Council's membership and governance structure is as follows:

479 1. The Advisory Council consists of seven members, to be appointed by the Governor, with
480 expertise in electronic identity management and information technology. Members include
481 a representative of the Department of Motor Vehicles, a representative of the Virginia
482 Information Technologies Agency, and five representatives of the business community with
483 appropriate experience and expertise. In addition to the seven appointed members, the
484 Chief Information Officer of the Commonwealth, or his designee, may also serve as an ex
485 officio member of the Advisory Council.

486

487 2. The Advisory Council designates one of its members as chairman.

488

489 3. Members appointed to the Advisory Council serve four-year terms, subject to the pleasure
490 of the Governor, and may be reappointed.

491

492 4. Members serve without compensation but may be reimbursed for all reasonable and
493 necessary expenses incurred in the performance of their duties as provided in § 2.2-2825.

494

495 5. Staff to the Advisory Council is provided by the Office of the Secretary of Technology.

496

497

498 The formation, membership and governance structure for the Advisory Council has been
499 codified pursuant to § 2.2-437.A, § 2.2-437.B, as cited above in this charter.

500

501 The statutory authority and requirements for public notice and comment periods for guidance
502 documents have been established pursuant to § 2.2-437.C, as follows:

503

504 C. Proposed guidance documents and general opportunity for oral or written submittals as to
505 those guidance documents shall be posted on the Virginia Regulatory Town Hall and published
506 in the Virginia Register of Regulations as a general notice following the processes and
507 procedures set forth in subsection B of § 2.2-4031 of the Virginia Administrative Process Act (§
508 2.2-4000 et seq.). The Advisory Council shall allow at least 30 days for the submission of written
509 comments following the posting and publication and shall hold at least one meeting dedicated
510 to the receipt of oral comment no less than 15 days after the posting and publication. The
511 Advisory Council shall also develop methods for the identification and notification of interested
512 parties and specific means of seeking input from interested persons and groups. The Advisory
513 Council shall send a copy of such notices, comments, and other background material relative to
514 the development of the recommended guidance documents to the Joint Commission on
515 Administrative Rules.

516

517

518 This charter was adopted by the Advisory Council at its meeting on December 7, 2015. For the
