

ISP announces release of NG9-1-1 GIS Resources page

Announcement by Matthew Gerike (ISP-VGIN Geospatial Program Manager),

Wednesday, March 26, 2019

Richmond (ISP) - VITA's Integrated Services Program (ISP) is pleased to announce the release of a new Virginia NG9-1-1 GIS Resources page on the Virginia Geographic Information Network (VGIN) Clearinghouse. The page is available here: [NG9-1-1 GIS Resources Webpage](#).

Two sets of resources are currently available on the page:

- The PSAP Boundary resource provides the development tools and segment compilation guidelines for PSAPs and localities to submit data to VITA for review and compilation in the Commonwealth-wide dataset that will be provided to next generation core service providers in Virginia.

A training webinar will be scheduled in the near future but feel free to read and follow the documentation. VITA ISP is ready to accept updated boundary segments now.

- The VITA GIS Data Report Card Tools for NG9-1-1 Preparation are an optional as-is package that allows localities to run the same analyses of their GIS road centerlines, GIS address points, MSAG, and ALI that VGIN runs as part of the Report Card process. This includes the Civic Address Layers Analysis, focusing on the geometry and attributes of the road centerlines and address points, and the GIS 911 Synchronization Analysis, which checks the degree to which the MSAG and ALI databases align with the road centerlines and address points. These tools consist of a user guide, ArcGIS toolboxes and scripts, data compiled by VGIN, and information on reporting exceptions to VGIN,

A webinar on using these tools is scheduled for Wednesday April 10, 2019.
